Opening Facebook links in external browsers

We've heard feedback that ad-blocking software doesn't work when websites open via the Facebook app, using Facebook's in-app browser.

Follow these steps on any Apple phone or tablet to any links in your preferred external browser (usually Safari).

Apple doesn't allow changes to its app settings so you will need to follow the instructions below for every link that is opened - but it's easier than it sounds!

- 1** Log into the Facebook app.
- 2** When you click on any external links, they will open in Facebook's in-app browser.
- 3** Tap on the triple-dot menu at the top right of your screen.
- 4** Tap Open in Safari.

The option may say Open in Safari, however your device will open the default app for viewing the selected link (e.g. if it's a YouTube link it will open the YouTube app).

This solution may stop working because Facebook regularly updates their settings. If you notice any changes, let us know by emailing socialmedia@pgf.nz
